

## Color codes:

Content mapped into Alarm/TCA parameters carried by Notification/Streaming mechanisms.

Content NOT mapped into Alarm/TCA parameters but useful for documentation and/or formal specification

Content which requires further analysis

### Differences wrt version 1.0.0

Sanitized all hyphens with underscores in:

- Probable Cause / Alarm Condition Name: OMS SSF-O and SSF-P --> SSF\_O, SSF\_P
- Additional Info: DSR-LOM, DSR-CSF --> DSR\_LOM, DSR\_CSF

Specified the Alarm and TCA Qualifiers

Introduced the fields with

- *concatenated* LayerProtocolQualifier\_Alarm Qualifier\_Alarm Condition Name
- *concatenated* LayerProtocolQualifier\_TCAQualifier\_ThresholdIndicatorName

There are two options, either specify B and C columns or only D column

The LPQ (Layer Protocol Qualifier) is systematically present only in the D column option

"CONTRA" means "CONTRADIRECTIONAL", while "CODIRECTIONAL" is the default and is not coded with additional string.

### Differences wrt version 2.0.0

TAPI Standard TCAs, enhanced the optical power metrics.

### Differences wrt version 2.1.0

Minor editings.

## Notes:

An *alarm instance* (or better a detector of a specific condition) is unambiguously identified by:

- 1) Alarm Name
- 2) target-object-identifier (global class) plus target-object-name (local class)
  - Note that target-object-type is associated to unique UUID
- 3) Alarm qualifier

Examples of Alarm qualifiers:

For Connectivity Alarm Category in case same CEP instance may include monitoring at both ODU and OTU layers.

For Connectivity Alarm Category in case same CEP instance may include MIP parameters related to both co-directional and contra-directional monitoring.

For Equipment and Processing Alarm Category, e.g. the local id of the ActualNonFieldReplaceableModule which identifies more precisely/uniquely/unambiguously the alarm source.

For Environment Alarm Category, e.g. on the same Device instance may appear more Environmental alarm notifications with same Alarm Name.

A TCA instance (or better a detector of the specific condition) is unambiguously identified by:

- 1) PM Parameter Name
- 2) target-object-identifier (global class) plus target-object-name (local class)
  - Note that target-object-type is associated to unique UUID
- 3) Referenced OAM Job instance
- 4) TCA Qualifier
- 5) Granularity Period, only in case there is no OAM job related to the TCA detection

OTUk layers supported in 2.4

OTU2E not supported by ITU-T

The severity column specifies the alarm severity as defined by the default ASAP (Alarm Severity Assignment Profile) object (not yet explicitly modeled by TAPI)

TAPI 2.4 merges Alarm and TCA data types, which augments both Notification and Streaming objects.

This version of the spreadsheet does not include the following G.874 specified atomic functions:

- OTUkV/ODUk\_A\_Sk
- FlexO\_TT\_Sk
- FlexO-x\_TT\_Sk
- FlexO-x\_CTT\_Sk

Index	Probable Cause / Alarm Condition Name	Threshold Parameter / Threshold Indicator Name	Qualifier	Additional Info	Description (text, in yang comment, not a data node)	Category	Target Object Type	Layer Protocol Name of Target Object	Layer Protocol Qualifier of Target Object	Perceived Severity	ITU-T G.798, G.874 ITU-T 7041 - Generic framing procedure ITU-T G.806 - Characteristics of transport equipment – Description methodology and generic functionality	Other Notes
1	INSERTION-LOSS-HIGH	INSERTION-LOSS			Insertion loss between the TX and RX is beyond threshold. Insufficient input power for the OA to work correctly.	Connectivity	CEP	PHOTONIC_MEDIA	OTS, OMS, OTS OMS, UNSPECIFIED	Major	This alarm can be raised by various functional entities. It is assumed it is raised on the CEP which is nearest to the actual detection point.	For further analysis, as it may apply to Access Port - where the anomaly is detected. Note that also OTDR related alarms are detected on a "point", even if the mechanism is localizing the failure along the fibre.
2	LOCAL-FAULT maybe this is the signalling				Local Ethernet fault. The local interface has received a local-fault signal from the NE at the far end of the fiber, indicating that no Ethernet signal is being transmitted upstream of (and toward) the local NE.	Connectivity	CEP/MEP/MIP	DSR, ETH	GBE, 10_GBE_WAN, 10_GBE_LAN, 100_GBE	Minor	For further clarification, check IEEE	
3	REMOTE-ETHERNET-FAULT maybe this is the alarm raised when local-fault signal is received				Local Ethernet fault. The local interface has received a local-fault signal from the NE at the far end of the fiber, indicating that no Ethernet signal is being transmitted upstream of (and toward) the local NE.	Connectivity	CEP/MEP/MIP	DSR, ETH	GBE, 10_GBE_WAN, 10_GBE_LAN, 100_GBE	Minor	For further clarification, check IEEE	
4	LASER-TEMP-HIGH				Laser temperature too high	Equipment	Equipment	na	na	Minor		Is it assumed that cannot be related to a specific OTSi CEP?
5	LASER-TEMP-LOW				Laser temperature too low	Equipment	Equipment	na	na	Minor		Is it assumed that cannot be related to a specific OTSi CEP?
6	OA-OUT-PWR-ABN				OA out power abnormal alarm	Equipment	Access Port	na	na	Minor		For further clarification
7	OPR-ABN				Abnormal optical power received	Equipment	Access Port	na	na	Critical		For further clarification
8	REMOTE-FAULT				Remote Ethernet fault.The alarm is indicating a defect in XGE services at the remote end.	Connectivity	CEP/MEP/MIP	DSR	GBE, 10_GBE_WAN, 10_GBE_LAN, 100_GBE	Minor		For further clarification IEEE?
9	RL-CRITICAL-HI				Critical high return loss alarm	Equipment	Access Port	na	na	Critical	Likely Applicable to OTS CEP	
10	RL-CRITICAL-LOW				Critical low return loss alarm	Equipment	Access Port	na	na	Critical	Likely Applicable to OTS CEP	
11	ETH_LOS				ETH Trib Port Loss Of Signal	Connectivity	CEP/MEP/MIP	ETH	GBE, 10_GBE_WAN, 10_GBE_LAN, 100_GBE	Critical	Not found in ITU-T, check 802.3	Which is the difference with respect to other UNI LOS?
12	R_LOS				OTN Client Port Loss Of Signal	Connectivity	CEP/MEP/MIP	DSR	GBE, 10_GBE_WAN, 10_GBE_LAN, 100_GBE_FC_100, FC_200, FC_400, FC_800, FC_1200, FC_1600, FC_3200, STM_1, STM_4, STM_16, STM_64, STM_256, OC_3, OC_12, OC_48, OC_192, OC_768, OTU_1, OTU_2, OTU_2E, OTU_3, OTU_4, GPON, XGPON	Critical	<b>CSF-LOS?</b> ODU2P to 10G Ethernet Reconciliation Sublayer adaptation sink function (ODU2P/ERS10G_A_Sk) ODUkP to ETH adaptation sink function (ODUkP/ETH_A_Sk) HAO-capable ODUk to ETH adaptation sink function (ODUkP-b/ETH_A_Sk)	For further clarification

## OTSiG|OCh non-intrusive monitor function

As the functionality of the OTSiG and OCh non-intrusive monitor functions is identical to the OTSiG-O\_TT\_Sk and OCh-O\_TT\_Sk functions (see clause 12.2.2.2), no dedicated OCh non-intrusive monitoring functions OTSiGm\_TT\_Sk and OChm\_TT\_Sk are defined.

Combined OTSiG|OCh and OTUk[V] non-intrusive monitor function (OCTk[V]m)

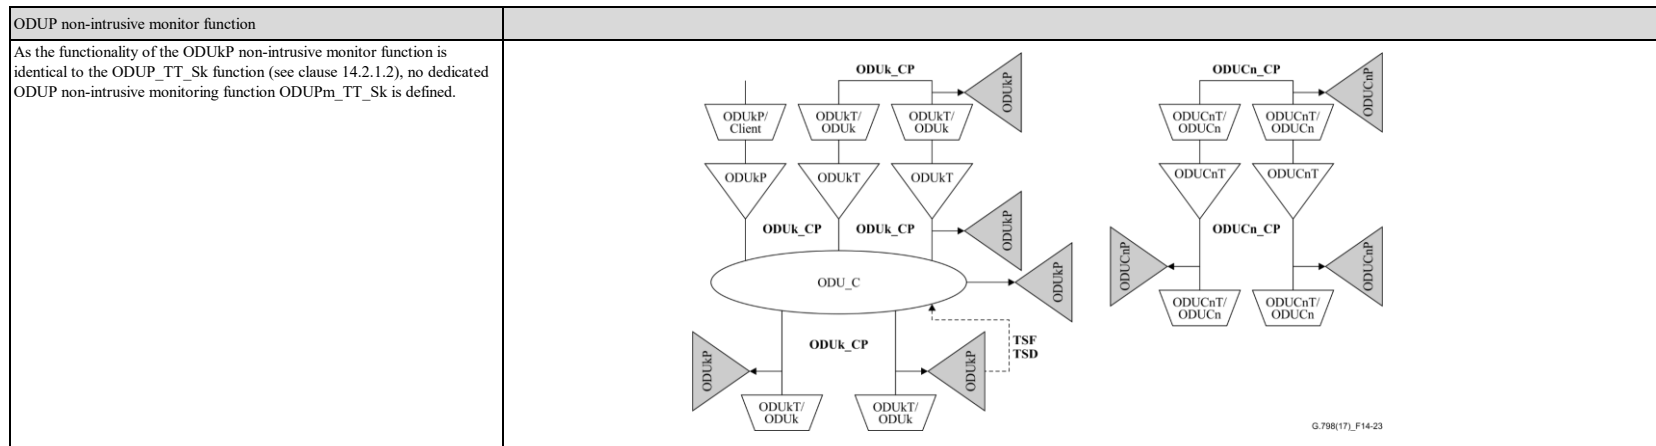

As the OCh and OTUk[V] terminations are always collocated in an OTN network, a combined OCh and OTUk[V] non-intrusive monitor is defined as a compound function OCTk[V]m. The OCTk[V]m compound function is the combination of a OTSiG-O)OCh-O\_TT\_Sk (see clause 12.2.1.2 or 12.2.2.2), OTSiS)OTUk[V]\_A\_Sk (see clauses 16.1.2 and 16.2.2) and OTUk[V]\_TT\_Sk (see clauses 13.2.1.2 and 13.2.2.2)

Combined OTSiG|OCh, OTUk[V] and ODUkT non-intrusive monitor function (OCTDk[V]m)

To support detection of bit errors in a serial compound ODUk link connection carried through an OCh domain with 3R regeneration, it is necessary to deploy ODUk tandem connection monitoring between the ODUk connection points at the endpoints of the ODUk serial compound link connection. For this purpose, a combined OCh, OTUk[V] and ODUkT non-intrusive monitor is defined as a compound function OCTDk[V]m. The OCTDk[V]m compound function is the combination of OTSiG-o/OCh-o\_TT\_Sk (see clause 12.2.1.2 or 12.2.2.2), OTSi/o/OTUk[V]\_A\_Sk (see clauses 16.1.2 and 16.2.2), OTUk[V]\_TT\_Sk (see clauses 13.2.1.2 and 13.2.2.2), OTUk[V]/ODUk\_A (see clauses 13.3.1 and 13.3.2) and ODUkT TT (see clause 14.5.1.1)

OTU\_TT\_Sk - Including both OTUk TT\_Sk and OTUCn TT\_Sk  
 ODUP\_TT\_Sk - Including both ODUkP\_TT\_Sk (k=0,1,2,2e,3,4,flex) and ODUcN\_TT\_Sk  
 ODU\_TT\_Sk - Including ODUkT\_TT\_Sk and ODUcN\_TT\_Sk
